01 · A different way to work

Modelled from a bus.

Phone only · voice only · cloud sessions

AI-assisted actuarial work, away from the desk.

10+
parallel helper sessions

12
Part 2 submissions

125
automated tests

Music: generated for this video by Claude Code (scripts/video/make_music.py) · all numbers from docs/experiments/RESULTS.md

02 · The result

Two weeks. Two markets.

WEEK 1 · DEVELOPED MARKET

#3

of 54 teams

private D^2 0.13864

2.4 million policy rows

3 lines · 4 years · frequency × severity + nets

WEEK 2 · EMERGING MARKET

#2

private leaderboard

public D^2 0.16458

2 years of data · 76% new business

same engine, adapted: what to carry over, what to re-measure

1 **Oct 17** Part 1 opens

2 **Oct 24** New market arrives

3 **Oct 30** Final files

Music: generated for this video by Claude Code (scripts/video/make_music.py) · all numbers from docs/experiments/RESULTS.md

03 · What changed

+34%

motor claim frequency

−42%

motor mean claim cost

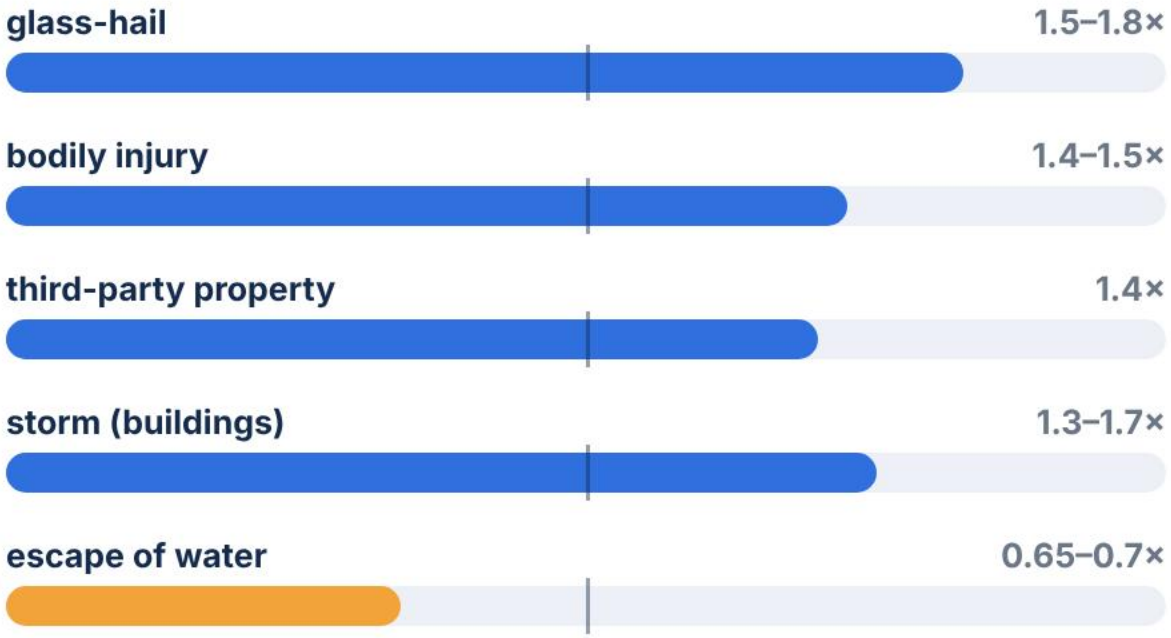

76%

of the 2025 test book is new business
no claim history

Claim frequency, emerging ÷ developed

ranges measured in both years · 1.0× = same as developed

Music: generated for this video by Claude Code (scripts/video/make_music.py) · all numbers from docs/experiments/RESULTS.md

04 · The method

🌍 **Developed model**

2.4M rows · variables both markets share

›

🕑 **+ Claim history**

last year: policy · address · customer

›

🧩 **Ensemble**

5 trees · 7 nets · 4 Tweedie

›

📍 **Level from emerging book**

counts × winsorised severity · credibility-weighted

›

⚖️ **Gender factor**

one flat factor per line

The ensemble: 16 models, averaged in groups

5 tree models

7 neural nets

4 Tweedie GBMs

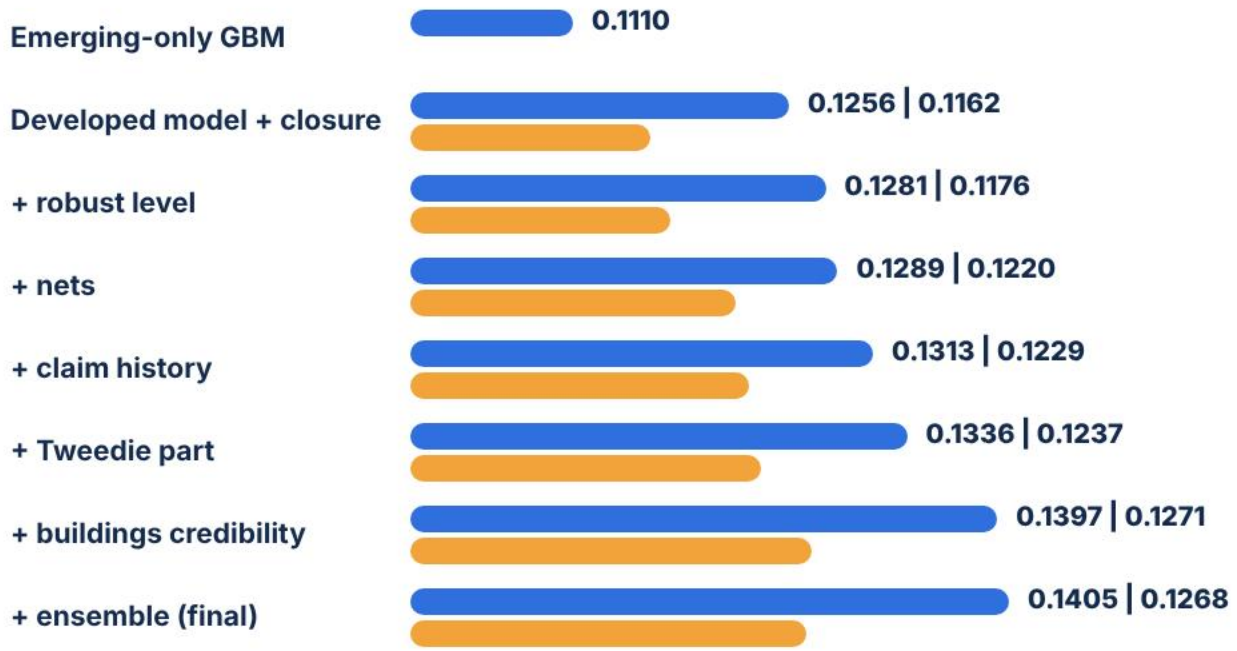

The emerging data decides how much. The developed data decides who.

05 · How we trust it

Pooled D^2 on the emerging book, every step tested both ways

forward (calibrate 2023 → score 2024) reverse (2024 → 2023) · axis starts at 0.10

30+ ideas rejected

- ✕ Pooled training with a market flag
- ✕ GLM in the blend
- ✕ Quantile-input net on its own
- ✕ Clipping high predictions
- ✕ Cross-line covariates
- ✕ Shared peril multipliers
- ✕ Domain-shift weights
- ✕ Slope calibration
- ✕ Multi-seed level refits
- ✕ Emerging-only models
- ✕ Per-line severity constants
- ✕ Claim history split by line
- ✕ ...and 18 more

SIMULATION

known truth: robust level beats plain closure

CEILING

≤ +0.005

D^2 from a perfect level

Music: generated for this video by Claude Code (scripts/video/make_music.py) · all numbers from docs/experiments/RESULTS.md

06 · AI in the workflow

Parallel helper sessions, refitting while I was away

HELPER 1 3-seed GBM + Tweedie	HELPER 2 3-seed TabM, history	HELPER 3 TabM nets, history
HELPER 4 TabM-PLE nets, history	HELPER 5 direct Tweedie GBM	HELPER 6 MIX construction
HELPER 7 GBM settings screen	HELPER 8 market-normalised features	HELPER 9 premium-free model
HELPER 10 entity embeddings	HELPER 11 recency & domain shift	HELPER 12 XGBoost & CatBoost

1 Unsupported statements

Three claims in the first data review had no evidence: replaced by measured values before commit.

2 A bias that was a bug

The simulation showed every estimator biased low; the plain closure had it too: the test harness was wrong, conclusion withdrawn.

3 Already rejected

A net we built had failed in Part 1 on the big folds; the public score agreed. We now search the record first.

07 · Guardrails and uncertainty

🚨
Leak alarm
D^2 above 0.35 stops a run

🔁
Reproducible
re-run matches to 1e-6

📋
Model card
monitoring triggers

🧾
84 decisions
each with its evidence

Main stated uncertainty: the buildings level

Limits we state

⚖️ Gender is a rating factor: flagged for regulatory review; a gender-free file is the alternative

📉 Two emerging years, 76% new business: the level, not the ranking, is the risk

🧪 Public scores within 0.0002: we select by local validation

Kohei Kudo · IAA AI-Assisted Hackathon 2026

Built with an AI teammate, from a bus seat.

Week 1 · #3 of 54 | Week 2 · #2
